

```

sudo apt update && sudo apt upgrade -y
sudo apt install openjdk-11-jdk -y
java -version
wget https://dlcdn.apache.org/hbase/2.6.2/hbase-2.6.2-bin.tar.gz
tar -xvzf hbase-2.6.2-bin.tar.gz
mv hbase-2.6.2 hbase
nano ~/.bashrc
paste this
export HBASE_HOME=~/.hbase
export PATH=$HBASE_HOME/bin:$PATH
export JAVA_HOME=/usr/lib/jvm/java-11-openjdk-amd64
save
source ~/.bashrc
nano ~/hbase/conf/hbase-site.xml
add in configuration
<property>
    <name>hbase.rootdir</name>
    <value>file:///home/your_username/hbase_data</value>
</property>

```

Replace `your_username` with your actual Ubuntu username.

```

mkdir -p ~/hbase_data
start-hbase.sh
jps

```

You should see output similar to:

```

HMaster
HregionServer

```

To open the HBase shell, run:

```
hbase shell
```

Try creating a test table:

```

create 'test_table', 'cf'
list

```

If the table is created successfully, HBase is working fine

```
put 'test_table', 'row1', 'cf:name', 'john doe'
```

```
get 'test_table' , 'row1'
```
